SWAT Helps Reclaim the Outdoors - Freeing Properties from Mosquitoes & No-See-ums and Cooling the Outdoor Temperature

SWAT Mosquito Systems & Outdoor Cooling, a mosquito control company in South Florida, introduces a new evaporative cooling system along with its long-trusted mosquito misting system as two technologies to help Floridians take control of the outdoors.

During the summer, most people hide indoors, day and night, to get away from the heat and from insects. Even pools can become unpleasant because of how many insects wait outside to prey on swimmers, especially at night. Outdoor nights can be almost unbearable. Citronella candles and bracelets provide some respite, but the smell and the limited range of effectiveness make many Floridians leery of relying on these methods.

All over the southern U.S., beautiful backyards and swimming pools are going to waste because their owners can't use them. During the day, the summer sun bakes the outdoors making it uncomfortable to remain outside. At night, bugs are the enemy and they feast on any humans they find. Between the lingering heat and the countless insects, outdoor parties are very nearly unbearable.

Houses that have installed the SWAT Mosquito System report 90%-100% less mosquitoes, no-see-ums, and other biting insects.

Homeowners aren't the only ones suffering. Business establishments that are partly or entirely outdoors also face difficulties. Of all commercial establishments, restaurants have among the worst problems with outdoor seating at night. Because many insects, such as flies and mosquitoes, carry numerous diseases, restaurants risk health and sanitation concerns should these flying insects invade a diner's meal.

In addition, due to the heat, restaurants cannot fill their outdoor seating, leading to long indoor wait times and disgruntled customers. New indoor smoking bans require smokers to go outdoors, and restaurants are losing customers who do not want to be forced to smoke outside in uncomfortable heat.

In the past, homeowners and business owners had to accept these discomforts as inevitable. However, with advances in modern technology, people now have options to take charge of their outdoor locations. New devices in

the form of misting systems provide unobtrusive, effective means of controlling outdoor insect populations and cooling outdoor temperatures. The mosquito misting systems and cooling systems can be set around a yard or a business location and work according to their owner's schedule.

A mosquito misting system consists of nozzles installed strategically around an outdoor location, such as a backyard or an outdoor eating area. These nozzles release a pyrethrum or a rosemary oil based product that kills mosquitoes and other insects over the course of a day, cutting down on the population and eventually almost eliminating the problem. All good misting systems should be custom-designed by an expert who views the area and then assesses its specific needs and requirements. Based on that assessment, the expert will determine where the nozzles should be placed. A team of installation experts will then install the nozzles and hook them up to a control device that can be accessed by the owner.

The nozzles form a protective perimeter around a property. The systems can be set to spray at whatever intervals and duration the owner needs. Automated timers cut down on the amount of effort and work owners must invest in the system. The misting works best at night, when mosquitoes and similar insects are active, but systems can also be scheduled to spray before an outdoor party or event.

As summer temperatures continue to rise each year, Floridians increasingly find their outdoor areas uninhabitable due to the heat.

SWAT's Outdoor cooling systems also consist of several nozzles set around the area to be affected. These systems spray tiny droplets of water that evaporate before they have the opportunity to dampen people or objects in the area. The evaporative process cools the air in the vicini-

No More Getting Eaten Alive

"Since the installation of our new mosquito and no-see-um control system, we have been able to allow the kids to play outside without having to worry about them getting eaten up. As a mother, I am very relieved to not have to worry about mosquitoes and no-see-ums biting my kids anymore!"

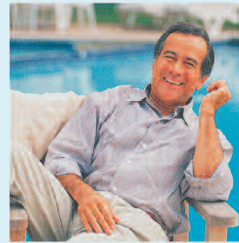

- Dana, Coral Gables

Back Outside Again

"One of the reasons why we bought our house was for the backyard — it's perfect for entertaining. Unfortunately, the mosquitoes and no-see-ums put an end to us having parties. Then my colleague gave me the number for SWAT Mosquito System & Outdoor Cooling and because of them, my wife and I are able to once again throw our famous backyard parties."

- Tom, Coral Gables

ty, and the overall effect lowers the temperature throughout the area. A well-designed cooling system lowers the temperature of an area 10-15 degrees.

Standard evaporative cooling systems shoot out large clouds of mist that dampen the area around them—not just the air but people, clothing, furniture, and more. Traditional evaporative cooling systems work well for large outdoor events with visitors who do not mind and perhaps even welcome being tangibly misted. However, as uncomfortable as the summer heat may be, most people do not want to get wet in order to combat it.

The SWAT evaporative cooling system sprays finer droplets of water (80% smaller than competitors) at a high pressure that evaporate more quickly and completely, having a cooling effect without forming a wet layer on anything. The system is patented, made for high humid environments, and has received great reviews in South Florida.

The combination of a mosquito misting system and evaporative cooling system can defeat insects and heat, turning outdoor areas into livable, enjoyable, comfortable spaces.
